Abstract. The national threat status of 898 species of vascular plants from the Bulgarian flora has been evaluated using Version 3.1 of the IUCN Red List Categories and Criteria. The resulting Red List of the Bulgarian vascular plants (threat categories) comprises 801 species (20.5 % of the total flora), of which one Extinct (EX), 12 Regionally Extinct (RE), 208 Critically Endangered (CR), 297 Endangered (EN), 204 Vulnerable (VU), and 79 Near Threatened (NT). The list of other evaluated species comprises 96 taxa, of which, 53 Data Deficient (DD) and 43 Least Concern (LC).

Key words: Bulgarian flora, endangered species, IUCN threat categories, plant conservation, Red List

*The authors are cited in alphabetical order of their family name.

Introduction

Red Listing is a valuable tool for raising the awareness about those taxa which face the risk of extinction. It is the first step towards highlighting the problem of species decline and loss, as well as encouraging policy-makers and communities to undertake measures for the improvement, or at least maintenance of the current state of biodiversity.

The threat status of the Bulgarian vascular plants was assessed for the first time in the 1980s and resulted in the publication of the *Red Data Book of the People's Republic of Bulgaria* (Velchev 1984). It comprises a total of 763 species divided into three categories of threat: 'extinct' (31 species; including 'probably extinct'), 'endangered' (158 species) and 'rare' (574 species). While assigning the threat categories, the authors considered the available data for the species, such as number and size of the localities in the country, past and present distribution areas of the species, number of individuals and density of the species populations, reproductive system and recruitment potential, threats, present and potential vulnerability of species, etc. Special attention was paid to the Bulgarian and Balkan endemic species and the relic species with restricted distribution in the country.

In the last two decades plant diversity in the country has been facing increasing anthropogenic pressure which causes deterioration and loss of habitats and/or direct destruction of species populations by trampling, grazing, infrastructural development, stone-pitting, etc. It became urgently necessary to update and re-evaluate the risk of extinction for the species in the Bulgarian flora. Therefore, in 2003 a two-year project of the Institute of Botany, Bulgarian Academy of Sciences, entitled *Elaboration of Red Lists of higher plants and fungi* was funded by the Bulgarian Ministry of Environment and Water and carried out by a team of over 30 botanists and mycologists from the country. The resulting *Red List of fungi in Bulgaria* (Gyosheva & al. 2006) and *Red List of the bryophytes in Bulgaria* (Natcheva & al. 2006) have already been published. In this article we present the updated *Red List of the Bulgarian vascular plants*.

Methods

Since the Bulgarian vascular flora comprises some 3900 species (Petrova & Vladimirov 2007), too much

to be evaluated within a two-year project, initial screening of the species was carried out by an expert group. About 900 species (ca. 23 % of the total Bulgarian flora) were selected considering the following criteria: presence in the *Red Data Book of the People's Republic of Bulgaria*, endemics, rarity in the country, occurrence in rare and vulnerable habitats, listing in the 1997 *IUCN Red List of Threatened Plants* (Walter & Gillett 1998), *Habitats Directive* (Directive 92/43/EEC) and biodiversity conventions, etc. The selected species were evaluated using the IUCN criteria and categories, version 3.1 (IUCN 2001, 2003a) and the available guidelines for application of these categories at regional level (Gärdenfors & al. 2001; IUCN 2003b). In many (if not most) cases precise data about the population size and threatening factors in the particular locations were insufficient or altogether lacking. In these cases a precautionary but realistic approach has been applied. In a few cases recently described or recorded in the country the species have been evaluated despite the recommendation in the IUCN documents not to include such taxa for at least 10 years after their discovery. The reason was that these taxa occur in specific habitats, rare in the country (thus much wider distribution of the particular species is very unlikely) and in places with already obvious threatening factors.

The evaluation for each taxon was documented in the Red List Assessment Questionnaire and Authority files available from <http://www.iucn.org/themes/ssc/sis/authority.htm>. The filled-in documents are kept at the National Nature Protection Service Directorate of the Bulgarian Ministry of Environment and Water.

Taxonomy of the plants generally follows Kozuharov (1992) or Delipavlov & Cheshmedzhiev (2003).

Results and discussion

The results of the evaluation process are presented in Table 1, which gives the taxon name and affiliation to family, national IUCN category and name of the evaluator(s). The species are arranged by their threat categories, and under each category in alphabetical order within the major taxonomic groups (*Pteridophytes*, *Gymnospermae* and *Angiospermae*). For seven species the threat category has already been published elsewhere and this is indicated in the Table.

The present Red List with a national IUCN category (EX+RE+CR+EN+VU+NT) comprises a total of 801 species (20.5% of the Bulgarian flora) (Table 2). Of these, 495 species (61.7%) are legally protected by the national *Biological Diversity Act* (BDA) (2002, 2007) which is indicated in Table 1 with bold.

Some species considered rare in the Bulgarian flora have not been evaluated yet. The main reason was

the lack of contemporary information about their localities and population state.

Acknowledgements. The financial support of the Bulgarian Ministry of Environment and Water to the project *Elaboration of Red Lists of higher plants and fungi* is gratefully acknowledged. Special thanks are extended to Ms. Daniella Ivanova for her help in the preparation of the project's final report.

Table 1. List of the evaluated taxa:

EX – Extinct; RE – Regionally Extinct; CR – Critically Endangered; EN – Endangered; VU – Vulnerable; NT – Near Threatened; DD – Data Deficient; LC – Least Concern; BDA – Biological Diversity Act; ● species included in Annex IV of the Directive 92/43/EEC; ▼ species included in Annex I of the Bern Convention (1979); species in bold are legally protected by the *Biological Diversity Act* (BDA) (2007)*.
